

Covered in this lecture:

Explaining the concept of strings

- ▶ If you want to save a variable as text, you have to store it as a string
- ▶ There are different rules for each language, but usually you would use quotations to delimitate text
- ▶ The computer will consider whatever is between the quotations as human language and won't run it as code
- Escape commands allow you to modify the text within your quotations, like put in on two separate lines

Example: "This is /n a text"
